1. Ans (2)

$\vec{a}.\vec{v} = -3 - 1 + 2 = -2$

$\vec{a}.\vec{v} < 0$

$\theta > 90°$ between $\vec{a}$ & $\vec{v}$

$\Rightarrow$ speed decreasing

2. Ans (1)

$a_x = 0$

$\Rightarrow v_x =$ constant

3. Ans (4)

$\Rightarrow$ Acceleration $= 4t - 3 \Rightarrow$ at $t = 1 \Rightarrow a = 1$ m/s^2

$\Rightarrow v = 2t^2 - 3t + 1 \Rightarrow$ at $t = 2 \Rightarrow v = 3$ m/s^2

$\Rightarrow a = 0 \Rightarrow 4t - 3 = 0 \Rightarrow t = \frac{3}{4}$ sec

$\Rightarrow a_{avg} = \frac{\Delta v}{\Delta t} = \frac{v_2 - v_1}{t_2 - t_1} = \frac{3-1}{2-0} = 1$ m/s^2

4. Ans (2)

average speed $V_{av.} = \frac{v_1t_1 + v_2t_2 + v_3t_3 + \ldots.}{t_1 + t_2 + t_3 + \ldots..}$

If $t_1 = t_2 = t_3 = \ldots\ldots\ldots = t$

Then $V_{av.} = \frac{(v_1 + v_2 + v_3 + \ldots.)\,t}{nt}$

or $V_{av.} = \frac{v_1 + v_2 + v_3 + \ldots}{n}$

It means that, average speed may be equal to arithmetic mean of individual speeds.

5. Ans (1)

Comparing with the standard equation of projectile;

$y = x\tan\theta - \frac{gx^2}{2u^2\cos^2\theta}$

we get, $\theta = 45^o$ and $u = 20\sqrt{2}$ m/s

Time of flight = $\frac{2u\sin\theta}{g}$

$= \frac{2 \times 20\sqrt{2} \times \sin 45^o}{10} = 4\text{sec}$

i.e., projectile comes back to same initial level after 4 sec. Hence its velocity vector will again make 45° with the horizontal.

Horizontal range = $\frac{u^2\sin 2\theta}{g}$

$= \frac{\left(20\sqrt{2}\right)^2 \sin 90^o}{10} = \frac{400 \times 2}{10} = 80\text{m}$

Maximum height = $\frac{u^2\sin^2\theta}{2g}$ and $\theta = 45°$

Maximum height = $\frac{\left(20\sqrt{2}\right)^2 \sin^2 45^o}{2 \times 10} = 20$ m

6. Ans (4)

O_1 : Ma, a_1, Mg — $(F_{net} = Ma_1)$, $Mg - Ma = Ma_1$, $a_1 = g - a$

O_2 : a_2, Mg — $(F_{net} = Ma_2)$, $Mg = Ma_2$, $a_2 = g$

12. Ans (2)

Time of meeting $t = \frac{H}{V_0 + 0}$

$t = \frac{H}{V_0}$ …(1)

For ball from ground using eq. (2)

$S = ut + \frac{1}{2}at^2$

$\frac{H}{2} = V_0(t) - \frac{1}{2}g(t^2)$ …(2)

$\frac{H}{2} = V_0\left(\frac{H}{V_0}\right) - \frac{1}{2}g\left(\frac{H}{V_0}\right)^2$

$V_0^2 = gH$

$V_0 = \sqrt{gH}$

13. Ans (4)

$v = \alpha\sqrt{x} \Rightarrow \frac{dx}{dt} = \alpha\sqrt{x} \Rightarrow \frac{dx}{\sqrt{x}} = \alpha\, dt$

By integrating both sides $\int x^{-1/2}dx = \int \alpha\, dt$

$\Rightarrow \frac{\sqrt{x}}{1/2} = \alpha t \Rightarrow \sqrt{x} = \frac{1}{2}\alpha t \Rightarrow x = \frac{1}{4}\alpha^2 t^2 \;\; \therefore x \propto t^2$

14. Ans (2)

Time taken by coin to reach the floor is given by:

$h = 1/2gt2$

or $t = \sqrt{\frac{2h}{g}}$

In stationary lift, $t_1 = \sqrt{\frac{2h}{g}}$

In upward moving lift with constant acceleration a,

$g' = g + a$

$\therefore \quad t_2 = \sqrt{\frac{2h}{(g+a)}}$

Clearly, $g' > g$

Thus, $t_2 < t_1$.

15. Ans (4)

Let height of tower is h and body takes t time to reach to ground when it fall freely.

$\therefore \quad h = \frac{1}{2}gt^2 \qquad \ldots(i)$

In last second i.e. t^{th} sec body travels = 0.36 h

It means in rest of the time i.e. in (t − 1)sec it travels

$= h - 0.36\ h = 0.64\ h$

Now applying equation of motion for (t − 1) sec

$0.64h = \frac{1}{2}g(t-1)^2 \qquad \ldots(ii)$

From (i) and (ii) we get, t = 5 sec and h = 125 m

If electric field due to charge |q| at origin is E then electric field due to charges |2q|, |3q|, |4q| and |5q| are respectively 2E, 3E, 4E and 5E

$E_{(i)} = \sqrt{(5E)^2 + (5E)^2} = 5\sqrt{2}E,$

$E_{(ii)} = \sqrt{(3E)^2 + (3E)^2} = 3\sqrt{2}E,$

E(iii) = 4E + 2E = 6E and E(iv) = 3E + E = 4E

$\Rightarrow E_{(i)} > E_{(iii)} > E_{(ii)} > E_{(iv)}$

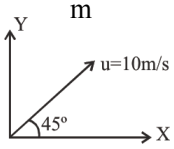

28. Ans (1)

$\because \quad E = \dfrac{\rho}{3\epsilon_0} r \quad \therefore \quad \dfrac{\rho}{3\epsilon_0} = \dfrac{4}{3} \quad \Rightarrow \rho = 4\epsilon_0$

$Q = \rho$ [volume] $= 4\epsilon_0 \left[\dfrac{4}{3}\pi 27\right] = 144\ \pi\epsilon_0$

29. Ans (4)

$a_x = \dfrac{qE}{m} = \dfrac{10^{-6} \times 2 \times 10^7}{2} = 10\ m/s^2$

Time of flight $T = \dfrac{2u\sin\theta}{g} = \dfrac{2 \times 10 \times \frac{1}{\sqrt{2}}}{10} = \sqrt{2}\,s$

Hence, Range $R = u_x T + \dfrac{1}{2} a_x T^2$

$R = 10 \cos 45° \times T + \dfrac{1}{2} a_x T^2$

$\dfrac{10}{\sqrt{2}} \times \sqrt{2} + \dfrac{1}{2} \times 10 \times 2 = 20m$

$\Delta U = U_f - U_i = \dfrac{kq^2}{a} = \dfrac{q^2}{4\pi\epsilon_0 a} = W.D$

31. Ans (3)

Since electric field lines point in the direction of decreasing electric potential, the potential decreases as one travels from initial point to final point on each line. Since the electric field is uniform and in the x-direction, equipotential lines will be perpendicular to the x-axis. Therefore, since the final position of each line has the same x-coordinate, each will have the same final potential. Plot c best describes this situation.

90. **Ans (4)**

Explanation -

The question asks which property (geometry, lone pairs, bond angle) is the same for the I_3^+ and I_3^- ions.

Concept - (Properties of I_3^+ & I_3^-)

- **Geometry:** I_3^+ is bent, and I_3^- is linear, so they have different geometries.
- **Number of lone pairs:** I_3^+ has 2 lone pairs, and I_3^- has 3 lone pairs, so they have a different number of lone pairs.
- **Bond angle:** I_3^+ has a bond angle of approximately 120 degrees, and I_3^- has a bond angle of 180 degrees, so they have different bond angles.

Conclusion:

Since I_3^+ and I_3^- differ in geometry, number of lone pairs, and bond angles, the correct answer is:

option (4). none of these
